

ApplyJet AI

Project Summary & Development Report

Generated June 28, 2026 · Author: PhucMaii

1. Project Overview

ApplyJet AI is a full-stack web application for job seekers. It provides a premium marketing landing site and an authenticated workspace where users upload a resume once, create job applications, and generate tailored resumes, cover letters, and HR contact lists — all in the browser.

The product evolved from a Chrome extension companion site into a standalone browser-based platform. Users sign up with email/password or OAuth (Google), manage their autofill profile, track applications, and upgrade via Stripe for unlimited generations.

2. Technology Stack

Category	Technologies
Frontend/src	React 19, Vite 8, TypeScript, React Router 7
Styling	Tailwind CSS v4, Framer Motion, custom theme tokens
3D / Effects	React Three Fiber, Three.js, mouse spotlight
Backend	Supabase (Auth, Postgres, Storage, Edge Functions)
Payments	Stripe Checkout, Customer Portal, Webhooks
Data fetching	TanStack React Query, React Hook Form
UI primitives	Radix UI (Tabs, Label, Slot), Lucide icons
Onboarding	Driver.js guided product tour
PDF parsing	pdfjs-dist for resume upload processing
Deployment	Vercel (vercel.json configured)

3. Application Architecture

3.1 Frontend Routes

- / — Marketing landing page (hero, how-it-works, pricing, CTAs)

- **/login, /signup, /auth/callback** — Authentication flows
- **/applications** — Protected list of job applications
- **/applications/new** — Create a new application from a job description
- **/applications/:id** — Application detail with generated docs & HR contacts
- **/profile** — User autofill profile, resume upload, billing & usage
- **/privacy, /terms, /support** — Legal and support pages

3.2 Key Source Directories

- **src/pages/** — Page-level components for each route
- **src/components/landing/** — Marketing sections and hero visuals
- **src/components/applications/** — Application CRUD, detail views, document previews
- **src/components/profile/** — Profile editors (contact, work, education, projects, skills)
- **src/components/onboarding/** — Welcome modal and guided tour
- **src/lib/skill-extractor/** — Job description skill matching engine
- **src/context/auth-context.tsx** — Supabase session management
- **supabase/functions/** — Stripe checkout, portal, and webhook handlers

4. Core Features Built

4.1 Authentication & User Management

- Email/password sign-up and login via Supabase Auth
- OAuth integration (Google) with auth callback handler
- Protected routes redirect unauthenticated users to /login
- Auth trigger auto-creates profiles, users, and subscription rows on signup

4.2 Profile & Resume Management

- Resume upload (PDF/DOCX) with automatic profile pre-fill
- Editable profile sections: contact, work experience, education, projects, links, skills, disclosure
- Autosave on profile edits — changes persist without manual save clicks
- Projects editor allowing users to input personal/side projects
- Private Supabase Storage bucket for resume files with RLS policies

4.3 Job Applications Workflow

- Create applications by pasting job title, company, and full job description
- Application list table with status badges and empty states
- Application detail page with overview, status updates, and inline editing
- AI-generated tailored resume per application
- AI-generated role-specific cover letter (works without job URL)
- HR contact finder — discover recruiters at the target company
- Delete application control with confirmation modal
- Document preview for generated resume and cover letter
- Match score showing skill overlap between profile and job description

4.4 Skill Extractor Engine

A custom skill-matching library parses job descriptions, detects sections (requirements, qualifications, etc.), extracts candidate skills, and matches them against a skill dictionary with fuzzy matching, alias resolution, and confidence scoring.

4.5 Billing, Usage & Pro Features

- Three-tier pricing: Free (\$0), Job Hunt Pack (\$3.99 one-time), Pro (\$9.99/mo)
- Stripe Checkout for Pro subscription and Job Hunt Pack purchase
- Stripe Customer Portal for self-service billing management
- Stripe webhook syncs subscription state into Postgres
- Usage tracking UI: resume generations, cover letters, HR contact searches
- Pro feature guard — limits free users and prompts upgrade when exhausted
- Usage metric cards with warning/exhausted states at 80%/100% thresholds

4.6 Onboarding & UX

- Multi-step onboarding tour powered by Driver.js (16 steps)
- Guides users: welcome → upload resume → review profile sections → create application → generate resume
- Welcome modal for first-time users
- Premium landing page with 3D hero canvas, trust strip, pricing, and comparison sections
- Rebrand from extension-first to browser-first product positioning
- Mouse spotlight cursor-follow glow effect on landing page
- Responsive layout with modern Tailwind design system

5. Database & Backend

- **profiles** — Display name and plan mirror for auth.users
- **users** — Full autofill profile (name, address, salary, summary, etc.)
- **resumes** — Metadata for uploaded resume files in Storage
- **applications** — Job applications with title, company, description, status
- **subscriptions** — Stripe customer/subscription IDs, plan, status, period end
- **user_usage** — Generation limits and usage counters per metric
- Row Level Security (RLS) on all tables — users can only access their own data
- Supabase Edge Functions: stripe-checkout, stripe-customer-portal, stripe-webhook

6. Development Timeline

Chronological commit history from April–June 2026 (24 commits):

Date	Commit	Description
2026-04-02	6df3d88	Initial project setup — React + Vite + Supabase scaffold
2026-04-03	d2c1b97	Email/password authentication
2026-05-07	7d2d68c	Extension download CTA routing
2026-05-20	ce5bc41	Theme redesign for improved visual polish
2026-05-21	3ab6a1c	Application detail page with resume & cover letter generation
2026-05-22	5f070e5	HR contact finder feature
2026-06-02	6a171be	Profile autosave
2026-06-02	595541a	Pro feature guard for usage limits
2026-06-02	81e24ee	User usage dashboard UI
2026-06-02	39eb889	OAuth auth callback handler
2026-06-03	479d965	Rebrand from extension to standalone website
2026-06-03	95845b2	Projects input section in profile
2026-06-05	9ee19cc	Delete application functionality
2026-06-07	1355e76	Onboarding tour initialization
2026-06-07	160b66f	Landing page rebrand and copy refresh
2026-06-23	92613ee	Job Hunt Pack one-time purchase tier

7. Summary

Over approximately three months, this project was built from scratch into a production-ready job application platform. The work spans frontend UI/UX (landing page, onboarding, profile editors, application management), backend infrastructure (Supabase schema, RLS, Storage, Edge Functions), payment integration (Stripe subscriptions and one-time purchases), and AI-powered document generation workflows. The codebase contains 200+ source files with a clean modular architecture, typed Supabase client, and a reusable skill matching engine.
